

2025 • AUGUST • HALLERTAU

# CROP DEVELOPMENT

## TEMPERATURE (°C)

## PRECIPITATION (MM)

## CURRENT SITUATION

- The harvest of the early varieties began in calendar week 35. Our crop estimate has already been published.  
→ [lupex.de/en/news/harvest-report-2025](https://lupex.de/en/news/harvest-report-2025)
- With around 70 liters of rainfall, water supply was sufficient during August, allowing the hops to develop well over the reporting period.
- Temperatures in August were above the long-term average, but with only six hot days, conditions still felt relatively moderate. Between May and August, there were a total of 22 days exceeding 30°C. By comparison, the 2024 harvest saw 30 hot days, 2023 recorded 27, and the record remains 2015 with 36.
- The impact of prolonged high temperatures on yields and quality is well understood from past harvests. We now look forward with great interest to the alpha values of the 2025 crop.
